Unit #2: Probability

Content Area: Mathematics
Course(s): Statistics H
Time Period: Semester 1 & 2
Length: 4 weeks
Status: Published

Standards

| MA.S-CP.A.2 | Understand that two events A and B are independent if the probability of A and B occurring together is the product of their probabilities, and use this characterization to determine if they are independent. |
|-------------|--|
| MA.S-CP.A.3 | Understand the conditional probability of A given B as $P(A \text{ and } B)/P(B)$, and interpret independence of A and B as saying that the conditional probability of A given B is the same as the probability of A , and the conditional probability of B given A is the same as the probability of B . |
| MA.S-CP.A.4 | Construct and interpret two-way frequency tables of data when two categories are associated with each object being classified. Use the two-way table as a sample space to decide if events are independent and to approximate conditional probabilities. |
| MA.S-CP.A.5 | Recognize and explain the concepts of conditional probability and independence in everyday language and everyday situations. |
| MA.S-CP.B.6 | Find the conditional probability of A given B as the fraction of B 's outcomes that also belong to A , and interpret the answer in terms of the model. |
| MA.S-CP.B.7 | Apply the Addition Rule, $P(A \ or \ B) = P(A) + P(B) - P(A \ and \ B)$, and interpret the answer in terms of the model. |
| MA.S-CP.B.8 | Apply the general Multiplication Rule in a uniform probability model, $P(A \ and \ B) = [P(A)] \times [P(B A)] = [P(B)] \times [P(A B)]$, and interpret the answer in terms of the model. |
| MA.S-CP.B.9 | Use permutations and combinations to compute probabilities of compound events and solve problems. |
| MA.S-MD.A.1 | Define a random variable for a quantity of interest by assigning a numerical value to each event in a sample space; graph the corresponding probability distribution using the same graphical displays as for data distributions. |
| MA.S-MD.A.2 | Calculate the expected value of a random variable; interpret it as the mean of the probability distribution. |
| MA.S-MD.A.3 | Develop a probability distribution for a random variable defined for a sample space in which theoretical probabilities can be calculated; find the expected value. |
| MA.S-MD.A.4 | Develop a probability distribution for a random variable defined for a sample space in which probabilities are assigned empirically; find the expected value. |
| MA.S-MD.B.5 | Weigh the possible outcomes of a decision by assigning probabilities to payoff values and finding expected values. |
| MA.S-MD.B.6 | Use probabilities to make fair decisions (e.g., drawing by lots, using a random number generator). |
| | |

Enduring Understandings

1) Understanding how certain probability models are used in specific situations.

| 2) Recognizing the importance of distinguishing between choosing objects both with and without replacement, and how that affects the type of probability model that is used. |
|---|
| Essential Questions 1) Will students recognize and apply various probability rules? 2) Will students be able to differentiate and answer questions involving various probability distributions? |
| Knowledge and Skills Students will be able to apply various probability models to answer questions about the likelyhood of events happening. |
| Transfer Goals 1) There is no such thing as true randomness. |
| 2) There are differences between calculating theoretical and experimental probabiliities. Resources |
