## **Unit Overview**

---

Food becomes contaminated by exposure to harmful microorganisms, physical contaminants or chemical substances. There are three types of hazards that can cause contamination in a kitchen: physical, biological, and chemical. Food often becomes contaminated through improper handling. It is essential for foodhandlers to prevent the spread of foodborne illness. All the guidelines for keeping food safe to eat can be summed up in four basic steps – clean, separate, cook, and chill. Foodservice professionals need to know how to create a clean, safe, disease-free place that can be used for food preparation. Foodservice workers need to develop and to practice skills to prevent and properly respond to foodborne illness outbreaks. Sanitation is a continuous part of good, safe food production. The food industry is regulated by laws, health codes and work place standards at the local, state and federal levels. Understanding and putting these guidelines into practice is essential to ensuring food safety.
