Unit 8 Title: Reduction-Oxidation Chemistry and Electrochemistry

Learning Objectives

- Batteries take advantage of the spontaneous reductionoxidation reactions among atoms and ions to create electrical energy to fuel other processes
- Cell potential values measured as volts can be used to reinforce similarities and differences among atoms and ions and electron tendencies
- Energy changes during reduction and oxidation processes can be measured, and this energy may be used to fuel additional reactions
- Non-spontaneous redox reactions can be driven with the application of external energy from a battery
- The gain and loss of electrons in chemical reactions corresponds with periodic table properties and tendencies of the elements

Standards

| | |
|--------------|--|
| SCI.HS-PS3-5 | Develop and use a model of two objects interacting through electric or magnetic fields to illustrate the forces between objects and the changes in energy of the objects due to the interaction. |
| SCI.HS-PS1-4 | Develop a model to illustrate that the release or absorption of energy from a chemical reaction system depends upon the changes in total bond energy. |
| SCI.HS-PS1-1 | Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms. |
| SCI.HS-PS1-2 | Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties. |
