

# Unit 1: Why Don't We Fall Through the Floor?

Content Area: **Science**  
Course(s):  
Time Period: **MP1**  
Length: **45 instructional days**  
Status: **Published**

## NJSLS - Science

---

SCI.HS-PS1-3	Plan and conduct an investigation to gather evidence to compare the structure of substances at the bulk scale to infer the strength of electrical forces between particles.
SCI.HS-PS3-5	Develop and use a model of two objects interacting through electric or magnetic fields to illustrate the forces between objects and the changes in energy of the objects due to the interaction.
SCI.HS-PS2-6	Communicate scientific and technical information about why the molecular-level structure is important in the functioning of designed materials.
SCI.HS-PS1-1	Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms.
SCI.HS-PS2-4	Use mathematical representations of Newton's Law of Gravitation and Coulomb's Law to describe and predict the gravitational and electrostatic forces between objects.
SCI.HS-PS3-2	Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative position of particles (objects).

## Science and Engineering Practices

---

### Developing and Using Models

- Use a model to predict the relationships between systems or between components of a system (HS-PS1-1).
- Develop and use a model based on evidence to illustrate the relationships between systems or between components of a system. (HS-PS3-2, HS-PS3-5)

### Planning and Carrying Out Investigations

- Plan and conduct an investigation individually and collaboratively to produce data to serve as the basis for evidence, and in the design: decide on types, how much, and accuracy of data needed to produce reliable measurements and consider limitations on the precision of the data (e.g., number of trials, cost, risk, time), and refine the design accordingly. (HS-PS1-3)

### Using Mathematics and Computational Thinking

- Use mathematical representations of phenomena to describe explanations. (HS-PS2-4)

### Science Models, Laws, Mechanisms, and Theories Explain Natural Phenomena

- Theories and laws provide explanations in science. (HS-PS2-4)
- Laws are statements or descriptions of the relationships among observable phenomena. (HS-PS2-4)

### Obtaining, Evaluation, and Communicating Information

- Communicate scientific and technical information (e.g., about the process of development and the design and performance of a proposed process or system) in multiple formats (including oral, graphical, textual, and mathematical). (HS-PS2-6)

## **Disciplinary Core Ideas**

---

### **PS1.A: Structure of Properties of Matter**

- each atom has a charged substructure consisting of a nucleus, which is made of protons and neutrons, surrounded by electrons
- The periodic table orders elements horizontally by the number of protons in the atom's nucleus and places those with similar chemical properties in columns. The repeating patterns of this table reflect patterns of outer electron states (HS-PS1-1)

### **PS2.B: Types of Interactions**

- Newton's law of universal gravitation and Coulomb's law provide the mathematical models to describe and predict the effects of gravitational and electrostatic forces between distant objects. (HS-PS2-4)
- Forces at a distance are explained by fields (gravitational, electric, and magnetic) permeating space that can transfer energy through space. Magnets or electric currents cause magnetic fields. (HS-PS2-4)
- Attraction and repulsion between electric charges at the atomic scale explain the structure, properties, and transformations of matter, as well as the contact forces between material objects. (HS-PS2-6)

### **PS3.C: Relationship Between Energy and Forces**

- When two objects interacting through a field change relative position, the energy stored in the field is changed. (HS-PS3-5)

## **Crosscutting Concepts**

---

### **Patterns**

- Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena. (HS-PS1-1, HS-PS1-3, HS-PS2-4)

### **Structure and Function**

- Investigating or designing new systems or structures requires a detailed examination of the properties of different materials, the structures of different components, and connections of components to reveal its function and/or solve a problem. (HS-PS2-6)

### **Energy and Matter**

- Energy cannot be created or destroyed; it only moves between one place and another place, between

objects and/or fields, or between systems. (HS-PS3-2)

## Cause and Effect

- Cause and effect relationships can be suggested and predicted for complex natural and human-designed systems by examining what is known about smaller scale mechanisms within the system. (HS-PS3-5)

## Rationale and Transfer Goals

---

The purpose of this unit is to have students gain an understanding of how microscopic particles can have an effect on macroscopic objects. Students will review atoms and their structure in order to gain an understanding of how field forces are created. Students will then gain an understanding of how the strength of a field force is determined by the mass (gravitational field) or the amount of charge (electrostatic field) and how far away from the source of the field an object is. Students will then be able to apply what they learned about atomic composition and field forces to answer the main idea of why we don't fall through the floor.

## Enduring Understandings

---

- All matter is made up of atoms.
- Atoms have a positively charged nucleus and are surrounded by negatively charged electrons.
- Gravitation is the result of the attraction between all mass/matter.
- An electric force is a universal force that exists between any two charged objects.
- All charged objects have electric fields.
- As distance increases, the strength of a field will exponentially decrease.

## Essential Questions

---

Why are people on Earth stuck here while astronauts appear to be weightless? [[Phenomena](#)]

How does the weight (force of gravity) of an astronaut of a specific mass change at specific distances from Earth as the shuttle moves away from the Earth? [[Phenomena](#)]

How can an object exert a force on another object without touching it? [[Phenomena](#)]

Why do you get shocked when you get out of your car in the winter? [[Phenomena](#)]

## Content - What will students know?

---

A positively charged nucleus is composed of both protons and neutrons, surrounded by negatively charged

electrons.

The difference in the number of protons and electrons in an atom will determine the electric charge of an atom.

The strength of a force decreases as you move further away from the source of a field.

The molecular level structure of a material is important in the effect on a macroscopic object.

Changes in the relative position of objects in a field can affect the energy of the field.

### **Skills - What will students be able to do?**

---

Use the periodic table to predict patterns of behavior of the elements based on the attraction and repulsion between electrically charged particles and the patterns of outermost electrons that determine the typical reactivity of an atom.

Describe why the data about bulk properties would provide information about strength of the electrical forces between the particles of the chosen substance.

Correctly use the given mathematical formulas to predict the gravitational force between objects or predict the electrostatic force between charged objects.

Identify and communicate the evidence for why molecular level structure is important in how the structure and properties of matter determine the function of a material.

Develop a model in which they identify and describe the relevant components to illustrate the forces and changes in energy involved when two objects interact.

### **Activities - How will we teach the content and skills?**

---

Create an activity based around an interactive periodic table [[link](#)] that will allow students to determine how two atoms will interact with one another due to their respective electric fields.

Using the PhET simulation [[link](#)], show how an imbalance of protons and electrons will cause a net charge and how these net charges react to other objects with a net charge.

Calculate the strength of the gravitational force based on parameters given such as in this PhET simulation [[link](#)].

Using a simulation such as this one from PhET [[link](#)] students describe how outer-level electrons can cause two solid objects to not pass through one another.

Using this PhET simulation [[link](#)], understand what is meant by the term voltage and how it describes a change in energy based on the location to the source of a field.

## **Evidence/Assessments - How will we know what students have learned?**

---

Students will be able to determine whether any two atoms in close proximity to each other will attract and repel.

Students will be able to answer a question that explains the transfer of electrons between two objects and explain the net charge on each object after the transfer.

Students will be able to use Newton's Law of Gravitation equation and Coulomb's Law equation to solve for unknown variables within the equations.

Students will be able to answer the unit question, why don't we fall through the floor?

Students will be able to explain what happens to the energy of an object as it moves closer to or further from the source of a field correctly.

oPhysics [[Link](#)]

Physlet [[Link](#)]

## Career Readiness, Life Literacies, & Key Skills

TECH.9.4.12.CT.3

Enlist input from a variety of stakeholders (e.g., community members, experts in the field) to design a service learning activity that addresses a local or global issue (e.g., environmental justice).

TECH.9.4.12.CT.4

Participate in online strategy and planning sessions for course-based, school-based, or other project and determine the strategies that contribute to effective outcomes.

TECH.9.4.12.GCA.1

Collaborate with individuals to analyze a variety of potential solutions to climate change effects and determine why some solutions (e.g., political, economic, cultural) may work better than others (e.g., SL.11-12.1., HS-ETS1-1, HS-ETS1-2, HS-ETS1-4, 6.3.12.GeoGI.1,

	7.1.IH.IPERS.6, 7.1.IL.IPERS.7, 8.2.12.ETW.3).
TECH.9.4.12.IML.2	Evaluate digital sources for timeliness, accuracy, perspective, credibility of the source, and relevance of information, in media, data, or other resources (e.g., NJLSA.W8, Social Studies Practice: Gathering and Evaluating Sources).
TECH.9.4.12.IML.3	Analyze data using tools and models to make valid and reliable claims, or to determine optimal design solutions (e.g., S-ID.B.6a., 8.1.12.DA.5, 7.1.IH.IPRET.8).
TECH.9.4.12.IML.4	Assess and critique the appropriateness and impact of existing data visualizations for an intended audience (e.g., S-ID.B.6b, HS-LS2-4).
TECH.9.4.12.IML.5	Evaluate, synthesize, and apply information on climate change from various sources appropriately (e.g., 2.1.12.CHSS.6, S.IC.B.4, S.IC.B.6, 8.1.12.DA.1, 6.1.12.GeoHE.14.a, 7.1.AL.PRSNT.2).
TECH.9.4.12.IML.6	Use various types of media to produce and store information on climate change for different purposes and audiences with sensitivity to cultural, gender, and age diversity (e.g., NJLSA.SL5).

## **Interdisciplinary Connections/Companion Standards**

---

LA.SL.11-12.5	Make strategic use of digital media (e.g., textual, graphical, audio, visual, and interactive elements) in presentations to enhance understanding of findings, reasoning, and evidence and to add interest.
LA.RST.9-10.7	Translate quantitative or technical information expressed in words in a text into visual form (e.g., a table or chart) and translate information expressed visually or mathematically (e.g., in an equation) into words.
LA.RST.11-12.1	Accurately cite strong and thorough evidence from the text to support analysis of science and technical texts, attending to precise details for explanations or descriptions.
LA.WHST.11-12.2	Write informative/explanatory texts, including the narration of historical events, scientific procedures/experiments, or technical processes.
LA.WHST.11-12.7	Conduct short as well as more sustained research projects to answer a question (including a self-generated question) or solve a problem; narrow or broaden the inquiry when appropriate; synthesize multiple sources on the subject, demonstrating understanding of the subject under investigation.
LA.WHST.11-12.8	Gather relevant information from multiple authoritative print and digital sources, using advanced searches effectively; assess the strengths and limitations of each source in terms of the specific task, purpose, and audience; integrate information into the text selectively to maintain the flow of ideas, avoiding plagiarism and overreliance on any one source and following a standard format for citation.
LA.WHST.11-12.9	Draw evidence from informational texts to support analysis, reflection, and research.
MA.N-Q.A.1	Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.
MA.N-Q.A.2	Define appropriate quantities for the purpose of descriptive modeling.
MA.N-Q.A.3	Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.
