2.1 Multiplying Fractions

For use with Activity 2.1

Essential Question What does it mean to multiply fractions?

1 ACTIVITY: Multiplying Fractions

Work with a partner. A bottle of water is $\frac{1}{2}$ full. You drink $\frac{2}{3}$ of the water.

How much of the bottle of water do you drink?

THINK ABOUT THE QUESTION: To help you think about this question, rewrite the question.

Words: What is $\frac{2}{3}$ of $\frac{1}{2}$?

Numbers: $\frac{2}{3} \times \frac{1}{2} = ?$

Here is one way to get the answer.

- Draw a segment to represent a length of $\frac{1}{2}$.

- Show how to divide $\frac{1}{2}$ into three equal parts.

- Rewrite $\frac{1}{2}$ as a fraction whose numerator is divisible by 3.

- Each part is $\frac{1}{6}$ of the bottle of water, and you drank two of them. Written as multiplication, you have $\frac{2}{3} \times \frac{1}{2} = \frac{2}{6} \times \frac{1}{2} = \frac{1}{3}$.

You drank $\frac{1}{3}$ of the bottle of water.

2 ACTIVITY: Multiplying Fractions

A park has a playground that is \( \frac{3}{4} \) of its width and \( \frac{4}{5} \) of its length. What fraction of the park is covered by the playground?

**Fold** a piece of paper horizontally into fourths and shade three of the fourths to represent \( \frac{3}{4} \).

**Fold** the paper vertically into fifths and shade \( \frac{4}{5} \) of the paper another color.

**Count** the total number of squares. This number is the denominator. The numerator is the number of squares shaded with both colors.

\[
\frac{3}{4} \times \frac{4}{5} = \quad = \quad . \text{ So, } \quad \text{ of the park is covered by the playground.}

Joe goes on a camping trip with his aunt, his uncle, and three cousins. They leave at 5:00 P.M. and drive 2 hours to the campground.

Joe helps his uncle put up three tents. His aunt cooks hamburgers on a grill that is over a fire.

In the morning, Joe tells his aunt that he is making pancakes. He decides to triple the recipe so there will be plenty of pancakes for everyone. A single recipe uses 2 cups of water, so he needs a total of 6 cups.
Joe’s aunt has a 1-cup measuring cup and a ½-cup measuring cup. The water faucet is about 50 yards from the campsite. Joe tells his cousins that he can get 6 cups of water in only 4 trips.

When his cousins ask him how he knows that, he uses a stick to draw a diagram in the dirt. Joe says, “This diagram shows that there are four 1½s in 6.” In other words,

\[ 6 \div 1 \frac{1}{2} = 4. \]
